### IN THE CLAIMS:

Amended claims follow:

#### 1. - 22. (Cancelled)

23. (Currently Amended) A method for enhancing network throughput between an internal network and an external network to which a server is connected, comprising the steps of:

connecting two or more firewalls to the internal network;

determining whether a common TCP control block exists for a TCP connection between one of said firewalls and the server, and creating one if one does not exist;

sending a TCP connection request to the server from one of said firewalls; and

updating said common TCP control block based on the response from the server to said TCP connection request;

wherein said steps further comprise establishing a connection between said firewall and said server, and updating said common TCP control block with connection state data during said connection;

wherein said steps further comprise shutting down said connection, and updating said common TCP control block based on the type of shutdown performed;

wherein said common TCP control block is shared with one or more of said other firewalls.

### 24. - 27. (Cancelled)

28. (Currently Amended) A method for enhancing network throughput between an internal network and an external network to which a server is connected, comprising the steps of:

connecting two or more firewalls to the internal network;

receiving a TCP connection request from the server to one of said firewalls;

determining whether a common TCP control block exists for a TCP connection between said receiving firewall and said server, and creating one if one does not exist; and

updating said common TCP control block based on the TCP connection request from the server;

Docket: NAI1P072\_00.026.01

wherein said steps further comprise transmitting an acknowledgement and a requestion connection to the server, and updating said common TCP control block with the resulting connection state data;

wherein said steps further comprise establishing a connection between said firewall and the server and updating said common TCP control block during said connection with connection state data;

wherein said steps further comprise shutting down said connection, and updating said common TCP control block based on the type of shutdown performed;

wherein said common TCP control block is shared with one or more of said other firewalls.

29-35. (Cancelled)

36. (Currently Amended) A computer program product embodied on a computer readable medium for enhancing network throughput between an internal network and an external network to which a server is connected, comprising:

computer code for connecting two or more firewalls to the internal network;

computer code for determining whether a common TCP control block exists for a TCP connection between one of said firewalls and the server, and creating one if one does not exist;

computer code for sending a TCP connection request to the server from one of said firewalls; and

computer code for updating said common TCP control block based on the response from the server to said TCP connection request;

wherein a connection is established between said firewall and said server, and said common TCP control block is updated with connection state data during said connection;

wherein said connection is shut down, and said common TCP control block is updated based on the type of shutdown performed;

wherein said common TCP control block is shared with one or more of said other firewalls.

37. (Cancelled)

Docket: NAI1P072\_00.026.01

38. (Currently Amended) A computer program product embodied on a computer readable medium for enhancing network throughput between an internal network and an external network to which a server is connected, comprising:

p. 7

computer code for connecting two or more firewalls to the internal network; computer code for receiving a TCP connection request from the server to one of said firewalls;

computer code for determining whether a common TCP control block exists for a TCP connection between said receiving firewall and said server, and creating one if one does not exist; and

computer code for updating said common TCP control block based on the TCP connection request from the server;

wherein an acknowledgement and a request for connection is sent to the server, and said common TCP control block is updated with the resulting connection state data;

wherein a connection is established between said firewall and the server, and said common TCP control block is updated during said connection with connection state data;

wherein said connection is shut down, and said common TCP control block is updated based on the type of shutdown performed;

wherein said common TCP control block is shared with one or more of said other firewalls.

# 39. (Cancelled)

40. (Currently Amended) An apparatus for enhancing network throughput between an internal network and an external network to which a server is connected, comprising:

logic for connecting two or more firewalls to the internal network;

logic for determining whether a common TCP control block exists for a TCP connection between one of said firewalls and the server, and creating one if one does not exist;

logic for sending a TCP connection request to the server from one of said firewalls; and logic for updating said common TCP control block based on the response from the server to said TCP connection request;

wherein a connection is established between said firewall and said server, and said common TCP control block is updated with connection state data during said connection;

Docket: NAI1P072\_00.026.01

wherein said connection is shut down, and said common TCP control block is updated based on the type of shutdown performed;

wherein said common TCP control block is shared with one or more of said other firewalls.

## 41. (Cancelled)

42. (Currently Amended) An apparatus for enhancing network throughput between an internal network and an external network to which a server is connected, comprising:

logic for connecting two or more firewalls to the internal network;

logic for receiving a TCP connection request from the server to one of said firewalls,

logic for determining whether a common TCP control block exists for a TCP connection

between said receiving firewall and said server, and creating one if one does not exist; and

logic for updating said common TCP control block based on the TCP connection request from the server;

wherein an acknowledgement and a request for connection is sent to the server, and said common TCP control block is updated with the resulting connection state data;

wherein a connection is established between said firewall and the server, and said common TCP control block is updated during said connection with connection state data;

wherein said connection is shut down, and said common TCP control block is updated based on the type of shutdown performed;

wherein said common TCP control block is shared with one or more of said other firewalls.

## 43. (Cancelled)

- 44. (Previously Presented) The method of claim 23, wherein the external network includes the Internet.
- 45. (Previously Presented) The method of claim 28, wherein the external network includes the Internet.

Docket: NAI1P072 00.026.01

- 46. (Previously Presented) The computer program product of claim 36, wherein the external network includes the Internet.
- 47. (Previously Presented) The computer program product of claim 38, wherein the external network includes the Internet.
- 48. (Previously Presented) The apparatus of claim 40, wherein the external network includes the Internet.
- 49. (Previously Presented) The apparatus of claim 42, wherein the external network includes the Internet.
